# In detail

Ski schools and ski resorts that organise end-of-course races need a system that is simple, fast and easy to manage.

That is why Microgate has developed the 'Light' kit, designed for ski schools and supplied in a handy rucksack containing everything you need: the HiStart gate, HiLink radio, HiSens Radio photocell and the HiTiming app. The system allows you to record times, share results live and export rankings as PDF files. Athletes' data can be imported from the management system used for lesson timetables, whilst rankings can be grouped by instructor, making the organisation of prize-giving ceremonies quicker too.

Thanks to its portability, radio operation, compatibility with management systems and ease of use, the kit is ideal for both small ski schools and larger, more established organisations.

The system can be expanded with an RTPro chronometer to manage training sessions, official wired races and the display of times on a scoreboard. The use of HiSmart devices also allows for the automatic identification of competitors by linking their numbers to their passage through the photocells.

The partnership with AMSI, which actively contributes to the system's development by suggesting improvements, makes the purchase particularly good value for money.
